Accessing CanisiusGuest: Windows XP

Right-click on the wireless network icon in the system tray of your computer, near the clock in the lower-right corner of the screen. From the pop-up menu, left-click on the option for “View Available Wireless Networks”.

This will open a window listing the wireless networks that are available in the area. In the left pane of the window, click on the menu option for “Change advanced settings”.

In the Wireless Network Connection Properties window that opens, click on the “Wireless Networks” tab at the top. Click on the “Add...” button in the Preferred networks box in the lower part of the window.

You will need to manually add the CanisiusGuest network in order to connect to it. Enter the following information:

**Network name (SSID):** CanisiusGuest  
**Network Authentication:** Open  
**Data encryption:** Disabled

Make sure that the checkbox for “Connect even if this network is not broadcasting” is checked. Click “OK” to continue. You may get a warning that the network is unencrypted; this is expected. Click “Continue”. Click “OK” to close the Wireless Connection Properties window.

Momentarily, you should get an information pop-up indicating that you are connected.
